

5 Best Claude Code MCPs You Need to Install 🧠

These five turn Claude Code from a chatbot into a weapon. Install commands for each below or paste the one master prompt at the bottom that installs all five in a single message.

1. Playwright MCP

What it does: Claude controls a real browser. Clicks buttons, fills forms, pulls data off any page.

Install command:

```
claude mcp add playwright -- npx @playwright/mcp@latest
```

When to use it:

- You need to scrape a site that has no API
- You want Claude to test your own product UI
- You're automating a repeatable web task (lead gen, form filling, status checks)

2. Context7

What it does: Pulls live documentation into the chat. Claude stops hallucinating outdated APIs.

Install command:

```
claude mcp add --scope user context7 -- npx -y @upstash/context7-mcp
```

When to use it:

- You're using a library that updated in the last 6 months
- Claude keeps writing code that doesn't match current syntax
- You want version-specific docs (React 18 vs 19, Next 14 vs 16)

3. Sequential Thinking

What it does: Built by Anthropic. Claude stops guessing. It plans the whole problem step by step, branches when it's wrong, and revises before touching code. Plan mode times ten.

Install command:

```
claude mcp add sequential-thinking -- npx -y @modelcontextprotocol/server-sequential-thinking
```

When to use it:

- You're tackling a multi-step problem with unclear scope
- You want Claude to think before it codes
- You're tired of one-shot answers that miss the bigger picture

4. Codex Plugin

What it does: Deploy OpenAI's Codex (GPT-5.4) inside Claude Code. Codex actively challenges Claude's code. Two models, two companies, one session. Output gets insanely better.

Install command:

```
/plugin marketplace add openai/codex-plugin-cc  
/plugin install codex@codex-plugin-cc
```

[CONFIRM: exact slash command syntax per github.com/openai/codex-plugin-cc README]

When to use it:

- You want a second opinion before shipping anything important
- You're stuck on a bug Claude can't see
- Run `/codex:review` for a read-only second look, `/codex:adversarial-review` to have it challenge Claude's design, or `/codex:rescue` to hand the whole task off

5. Knowledge Graph Memory MCP

What it does: Also from Anthropic. Gives Claude a brain that persists. Stores three things in a local file all about you: entities, relationships, and observations. Survives across sessions.

Install command:

```
claude mcp add --scope project memory -e MEMORY_FILE_PATH=./.claude/memory.json --  
npx -y @modelcontextprotocol/server-memory
```

When to use it:

- You're tired of re-explaining your business every new chat
- You want Claude to reference decisions you made weeks ago
- You sync the JSONL file across machines and Claude remembers you everywhere

INSTALL ALL FIVE — Master Prompt

Paste this entire block into a fresh Claude Code session. It will run each install in order, confirm each one, and show you the final list.

Install these 5 MCP servers and plugins for me, one at a time. After each command, confirm it ran successfully before moving to the next. If any command fails, stop and tell me the exact error.

1. `claude mcp add playwright -- npx @playwright/mcp@latest`
2. `claude mcp add --scope user context7 -- npx -y @upstash/context7-mcp`
3. `claude mcp add sequential-thinking -- npx -y @modelcontextprotocol/server-sequential-thinking`
4. `/plugin marketplace add openai/codex-plugin-cc`
`/plugin install codex@codex-plugin-cc`
5. `claude mcp add --scope project memory -e MEMORY_FILE_PATH=./.claude/memory.json -- npx -y @modelcontextprotocol/server-memory`

After all five are installed, run `/mcp` to list every connected server and confirm everything shows as connected. If anything is missing or red, tell me which one and walk me through fixing it.
